

ABSTRACT

A vacuum packaging method and mechanism for vacuum sealing a sealing body mainly draws air by a vacuuming apparatus through the periphery of the vacuuming apparatus to adsorb the sealing body smoothly onto the vacuuming apparatus without
5 forming creases to prevent air from seeping into the sealing body; then move the front end of the vacuuming apparatus into the sealing body until reaching the core material contained in the sealing body for sucking air in the sealing body; meanwhile an airtight compression module and a thermal press sealing apparatus are used to seal the sealing body in a vacuum condition in a short period of time.
